

Documentation for Data Exported from the [ABCD Publications Dashboard](#)

Created and maintained by Diana Alkire (diana.alkire@nih.gov)

Inclusion criteria for publications

To align with widely accepted quality standards, the database excludes preprints and includes only papers from journals that are indexed in one or more of the databases listed below. Learn about the selection process for each database:

- [MEDLINE](#)
- [Web of Science](#)
- [Scopus](#)
- [Directory of Open Access Journals](#)
- NIH Library
 - Journal must be marked as “peer reviewed.” NIH librarians evaluate the peer review process of each journal on a case-by-case basis.

Variable organization (referenced by Microsoft Excel labels) and selected definitions

A-I: Article details

Publication year and date, title of article, authors, abstract, journal name, URL for the publisher page, DOI, and PubMed ID (PMID)

J-P: Bibliometrics

These metrics are derived from the NIH-hosted iSearch platform and are available only for papers indexed in PubMed (~96% of papers using ABCD data).

<i>Variable name</i>	<i>Definition (copied from iSearch user guide)</i>
RCR	Relative Citation Ratio: citation rate normalized by field, year, and NIH funding. The median NIH-funded paper has an RCR of 1, so an RCR of 2 means a paper has twice as many citations per year as would be expected.
RCR.Is.Provisional	RCRs for papers published in the previous two years are flagged as "provisional" to reflect that citation metrics for newer articles are not necessarily as stable as they are for older articles.
Cited.By.Clinical.Article	Flag to show whether a publication has been cited by a clinical article. Clinical articles are generally defined as Clinical Trials or Clinical Guidelines.
Clinical.Impact	A publication has clinical impact if at least one of the following is true: the publication was cited by a Clinical Trial that has results (from clinicaltrials.gov), the publication is a clinical article, or the publication was cited by clinical article.

Q-AG: Altmetrics

Q: Altmetric Attention Score (defined below)

R-AG: Counts of mentions on each platform tracked by [Altmetric](#).

<i>Variable name</i>	<i>Definition</i>
Altmetric Attention Score	Automatically calculated, weighted count of all of the attention a research output has received. Click for more details

The remaining variables result from coding by Diana Alkire

AH: ABCD membership

<i>Variable name</i>	<i>Definition</i>
ABCD.member	“yes” = authors include at least one ABCD member, defined as anyone currently or formerly associated with ABCD, e.g., included in the ABCD Coordinating Center roster or as key personnel on ABCD U grants. Excludes individuals whose only listed role is “consultant.”

AI-AS: Research domains included in the article

Domain categories correspond to ABCD Workgroups, except for “COVID,” which denotes the use of surveys on participants’ experience of the COVID-19 pandemic.

Note: “Friends, Family, & Community” refers to the workgroup formerly named “Culture & Environment.”

Domains are listed together (column AI), followed by dummy variables for each domain (1=included, 0=not included)

Note: If a measure was clearly used only as a nuisance variable or in secondary analysis, the corresponding domain code is not applied based on that measure alone. However, for data-driven (e.g., machine learning, predictive modeling) studies that use a large number of measures across domains, there isn’t usually a prioritization of constructs, so these are coded for all domains represented.
